

LISTING OF THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Canceled).
2. (Currently Amended) The radiation reflecting element of claim [[1]] 4, wherein said photonic element is controllable by means of electric signals.
3. (Original) The radiation reflecting element of claim 2, wherein said photonic element is essentially composed of a photonic material in a liquid crystal environment, such that a photonic band gap of said photonic material is capable of being influenced by influencing the liquid crystal material in the nematic and/or ferroelectric state by an electric field.
4. (Currently Amended) ~~The radiation reflecting element of claim 1,~~ An element reflecting electromagnetic radiation, specifically light, wherein said element comprises a photonic element having a controllable band gap, the photonic element being disposed in the beam path of and/or on a surface reflecting said radiation, for modulating the radiation passing through said element, wherein said element is essentially a prism and in particular a triple prism, and said photonic element is provided on at least one, preferably all prism surfaces intended for reflecting said radiation.
5. (Currently Amended) ~~The radiation reflecting element of claim 1,~~ An element reflecting electromagnetic radiation, specifically light, wherein said element comprises a photonic element having a controllable band gap, the photonic element being disposed in the beam path of and/or on a surface reflecting said radiation, for modulating the radiation passing through said element, wherein said reflecting element is a prism, preferably a triple prism, and said photonic element is disposed on the surface serving for the entrance and the exit of a beam of the radiation.

6. (Currently Amended) An object identification system comprising a laser of a determined wavelength for producing an electromagnetic beam, specifically a light beam, and at least one ~~reflecting element of claim 1~~ reflecting electromagnetic radiation, specifically light, wherein each of said at least one element comprises a photonic element having a controllable band gap, the photonic element being disposed in the beam path of and/or on a surface reflecting said radiation, for modulating the radiation passing through said element, said at least one element being provided on an object, wherein at least one, preferably all photonic elements of said at least one radiation reflecting element are chosen such that the reflective properties of the at least one radiation reflecting element are adjustable by controlling the photonic element or elements, more particularly switchable from high reflectivity to low reflectivity, for modulating the reflected light beam with data.

7. (Currently Amended) A method of modulating a beam of electromagnetic radiation, more specifically of a light beam, using ~~the reflecting an element of claim 1 for reflecting~~ electromagnetic radiation, specifically light, wherein said element comprises a photonic element having a controllable band gap, the photonic element being disposed in the beam path of and/or on a surface reflecting said radiation, for modulating the radiation passing through said element, said element transmitting data, said beam comprising a component of a wavelength for which said radiation reflecting element is switchable, by influencing at least one a portion of the photonic elements element thereof, between two states of higher and lower transparency and/or reflectivity.

8. (Original) The method of claim 7, wherein said beam is essentially composed of radiation of the wavelength that can be influenced.

9. (New) The radiation reflecting element of claim 5, wherein said photonic element is controllable by means of a electric signals.

10. (New) The radiation reflecting element of claim 9, wherein said photonic element is essentially composed of a photonic material in a liquid crystal environment, such that a photonic

band gap of said photonic material is capable of being influenced by influencing the liquid crystal material in the nematic and/or ferroelectric state by an electric field.
